

Tipulex

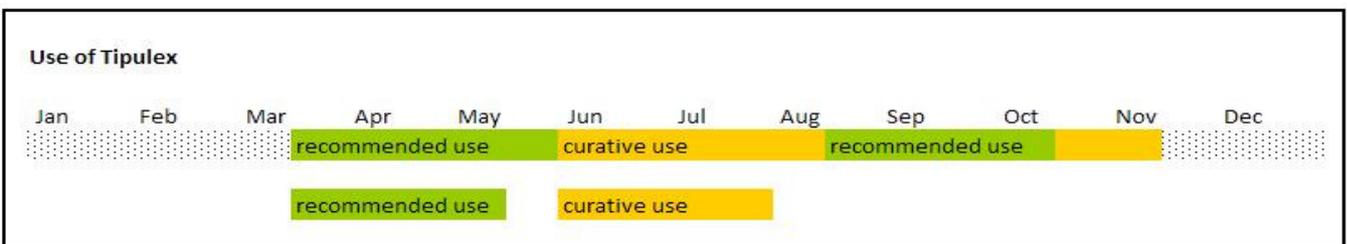

Tipulex

Tipulex is a granulate which controls Leatherjackets and Scarab grubs in grass. Tipulex contains plant extracts and organic fertilizers; the plant extracts repel the Scarab grubs and Leatherjackets, while the organic fertilizers stimulate root growth. Tipulex is a slow release product, which gradually releases its active ingredients into the roots and the soil over a long period of time. The granulate is easily spread, either manually or by machine.

Application of Tipulex:

Tipulex can be used either preventatively or curatively. For preventative use, we recommend a dosage of 100 kg per hectare. Preventative use stops the development of Leatherjackets and Scarab grubs. They become stunned by the plant extracts and therefore don't eat the grass. This greatly limits the damage. Tipulex works for approximately 6 to 8 weeks.

When damage has already taken place, higher dosage will be required at affected spots. We recommend doubling the dosage in such cases. The plant extracts in Tipulex stun the Leatherjackets and Scarab grubs, thus stopping them damaging the grass. The nutrients in Tipulex help the grass recover more quickly and therefore stimulate a stronger grass cover. And so the grass becomes more resistant to these two predators, Your paddock, lawn, sports field or golf course can quickly recover. Another great advantage is that birds such as crows etc. leave the grass sods alone after treatment.

It's important to start early:

Leatherjackets and Scarab grubs are larvae of various insects, with a variety of crane flies and beetles laying their eggs in the grass. There are two clear periods in which they are most troublesome. Early in May, crane flies and the cockchafer are the most damaging. Another such period occurs at the end of August and in September, caused by the summer chafer and crane flies this time around. Preventative treatment prior to these periods can limit the damage greatly or prevent it entirely. We advise you to apply Tipulex in mid-April and late August. If damage to the grass is noticed after all, repeat the dosage locally as necessary. Damaged spots can be treated all year round.

Treatment with Tipulex does not depend on the weather conditions. When used in warm weather, the granulate will lie waiting for moisture such as dew or rain in which it can be dissolved. Thanks to the organic fertilizers and plant extracts, Tipulex will not result in burning of the grass.
